

# Cement Supplemental Cementitious Materials (SCMs) and Sustainability Outlook

NESMEA Annual Meeting | Harrisburg, PA | Steve Somerville, P.E., Hie

October 28, 2025

## Agenda

### Background

- Usage & Emissions
- Policy

### Present Strategies

- Blended Cements
- Mix Optimization

### Future Outlook

- More/New SCMs
- CCUS

# Concrete Accounts for More Than 50% of Everything We Make<sup>1</sup>

## Most widely produced solid material on earth

- Concrete delivers...
  - Economy
  - Strength & Durability
  - Versatility
  - Resilience
- Because concrete is practically synonymous with the term construction it....
  - Is responsible for 7% – 8% of global manmade CO<sub>2</sub> emissions
  - Can be argued that this is a relatively small CO<sub>2</sub> investment for more than 50% of the stuff we make but, we are working to lower these numbers

<sup>1</sup>Rencontre du Conseil d'Etat avec la Présidence de l'EFL EPFL Fribourg,  
[https://www.concrete.org/portals/0/files/pdf/webinars/ws\\_S23\\_KarenScrivener.pdf](https://www.concrete.org/portals/0/files/pdf/webinars/ws_S23_KarenScrivener.pdf)

## Global CO<sub>2</sub> Emissions

Cement is a very sustainable material with relatively low environmental impacts.

Concrete is **the** global sustainable building material of choice; its CO<sub>2</sub> impacts are the very low.

## Embodied Carbon Policies Developing Across North America

<https://carbonleadershipforum.org/clf-policy-toolkit/#policymap>

# CO<sub>2</sub> during concrete production

- Process technology in cement
- Alternative binding agents, SCMs

- Local, low energy and low GWP building materials
- An uncouned CO<sub>2</sub> success factor

- Efficient logistics
- Utilising state-of-the-art drive units
- Openness for new technologies

- Renewable energy is a usable benefit today

CO<sub>2</sub> in concrete is more than just cement

# Agenda

## Background

- Usage & Emissions
- Policy

## Present Strategies

- Blended Cements
- Mix Optimization

## Future Outlook

- More/New SCMs
- CCUS

# Present Strategies to Decarbonize Concrete

## Reduce the clinker in cement and concrete

- Produce and use more SCMs to reduce CO<sub>2</sub> and optimize mixes
- Convert to producing Portland Limestone Cements (PLCs)
- Produce more Blended Cements i.e. Type IS(40)

## Reduce the CO<sub>2</sub> in clinker

- Increase energy efficiency in production
- Utilize natural gas and Alternative Fuels

## Educate users and stakeholders to reduce overdesign

- Utilize real time mix and maturity monitoring
- Optimize concrete mixes/element shapes and right sized design

## Clinker Factor in Cements

## Portland Limestone Cement: Type IL

Widespread roll-out of Type IL in North America began in 2021

Accepted by all 50 state DOTs and most Canadian provinces

Over 70% of cement produced in USA is Type IL

### Type IL is permitted:

- By codes, like ACI 318, Building Code Requirements for Structural Concrete
- By specifications, like ACI 301, Specification for Structural Concrete
- By standards, like ASTM C94, Specification for Ready Mixed Concrete
- And by the AIA MasterSpec that is used by design firms to develop their specifications for private projects.

# How Limestone Works

- Particle packing
  - Improved particle size distribution
- Nucleation
  - Surfaces for precipitation
- Chemical reactions
  - Only a small amount, but...

Portland Limestone Cement: Type IL

| Material             | ASTM C150<br>AASHTO M85<br>Portland Cement | ASTM C595<br>AASHTO M240<br>PLC |
|----------------------|--------------------------------------------|---------------------------------|
| Clinker<br>(typical) | 90 to 95 %                                 | 80 to 90 %                      |
| Gypsum<br>(typical)  | 4 to 6 %                                   | 4 to 6 %                        |
| Limestone            | 0 to 5 %                                   | 5 to 15 %                       |

# Cement Replacements - An Important Part of Today's Mixes

---

## Supplementary Cementitious Materials (SCMs)

- Defined by ACI Concrete Terminology ACI CT-23
  - “Supplementary cementitious material - inorganic material such as fly ash, silica fume, metakaolin, or slag cement that reacts pozzolanically or hydraulically”
- Combined in concrete mixes in conjunction with and to replace some of the Portland Cement binder
- SCMs have lower Global Warming Potentials (GWP) than Portland cement-based binders
- GWP (kg CO<sub>2</sub> equivalent aka CO<sub>2</sub> eq.)

## Portland Slag Cement Delivers Significant CO<sub>2</sub> Reductions

### Compare industry average vs. high performing plant in Generic Mix

- Industry Average Portland Cement Type I / GU @ 922 GWP

#### Calculation for PCA "Average" Portland Cement GWP in Concrete Mix A1

| Generic Concrete Mix Raw Materials A1          | Quantity<br>kg/m <sup>3</sup> | GWP / Metric ton<br>(1,000 kg) | GWP in Mix |
|------------------------------------------------|-------------------------------|--------------------------------|------------|
| Industry Average Portland Cement (GU / Type I) | 350                           | 922                            | 322.7      |

- Compared to actual EPD Data
- Heidelberg Materials Evansville Plant
  - Preheater/Precalciner
  - Produces IS(40) Cement
- Portland Cement Type I @ 841 GWP
- Portland Slag IS(40) @ 531 GWP

| Environmental Impacts                                                                              |                 |           |          |          |            |            |
|----------------------------------------------------------------------------------------------------|-----------------|-----------|----------|----------|------------|------------|

**Environmental Product Declaration (EPD) for Cement**

**GENERAL INFORMATION**

This cradle to gate Environmental Product Declaration covers six cement products produced at the Evansville Cement Plant. The Life Cycle Assessment (LCA) was prepared in conformity with ISO 21930, ISO 14025, ISO 14040, and ISO 14044. This EPD is intended for business-to-business (B-to-B) audiences.

Heidelberg Materials  
Evansville Cement Plant  
537 Evansville Rd  
Fleetwood, PA 19522

PROGRAM OPERATOR  
National Ready Mixed Concrete Association  
900 Spring Street  
Silver Spring, MD 20910

Additional detail and impacts are reported on page 5 and 6

**Harvested Coal Ash Beneficiation Facility**  
**> Million Tons Processed Annually**

## Adapting Our Business to Build a Net Zero Future with Beneficiated Ash

### Fly Ash is low GWP replacement for concrete

#### Securing fly ash supply to further reduce our CO2 footprint

- Heidelberg is the leader in Beneficiated Ash
- Acquired SEFA Group in 2023 secures largest recycled fly ash sources in USA
- This strengthens our ability to provide low-carbon cementitious products in key markets
- Beneficiated ash is hugely important SCM
- > 1-Million tons beneficiated ash sold in 2023
- > Billion tons of available as landfilled ash
- Estimates of having at least 60-year of supply

# Concrete Mix Design – Methods to reduce CO<sub>2</sub>

- Optimize Total Aggregate Gradations (5 – 15%)
- Portland Limestone Cement (6-8%)
- Increased Levels of SCM's (Proportional to reduction)
- Use CO<sub>2</sub> Mineralization (3 – 6%)
- All 4 can be done simultaneously

## Sustainability vs Over Design

Green mix (SD = 500 psi) requires around 31 lb/yd<sup>3</sup> less cement compared to the Blue Mix (SD = 750 psi)

## Agenda

### Background

- Usage & Emissions
- Policy

### Present Strategies

- Blended Cements
- Mix Optimization

### Future Outlook

- More/New SCMs
- CCUS

## Future Strategies to Decarbonize Concrete

---

### Reduce the clinker in cement and concrete

- Produce and use more SCMs to reduce CO<sub>2</sub> and optimize mixes
- Produce more Blended Cements i.e. Type IT(P20)(L10)
- Further develop new SCMs (calcined clay, ground glass, natural pozzolans)

### Reduce the CO<sub>2</sub> in clinker

- Increase energy efficiency in production
- Utilize natural gas and Alternative Fuels
- Develop CCUS technologies for Net Zero Concrete

### Educate users and stakeholders to reduce overdesign

- Utilize real time mix and maturity monitoring
- Optimize concrete mixes/element shapes and right sized design

## Understanding the role of calcination in cement's CO<sub>2</sub> emissions

Embodied carbon in cement A1 – A3, “Cradle to Gate”

# Carbon Capture & *Permanent* Storage

## Storage

- CO<sub>2</sub> to be stored in deep saline reservoirs
- Permanent storage 1,500-3,000 meters below ground in porous brine filled rock under multiple layers of impermeable cap-rock
- Far below potable water and oil and gas reservoirs
- Current known global storage capacity 40 million tons/yr.
- Storage capacity and efficacy subject to MMV (Measurement, Monitoring, and Verification)

**Thank you!**
